Claims Curated Registry

Problems with TCR's today

- Complex
 - Token Economic models
 - Complex Governance
- Token not required for all types of registries
- User experience is often too frictioned

Why Claims Curated Registries

- Able to enter the registries for the benefit of association, agreed upon by the group.
- Simple to use.
- CCR can be interpreted as it's own decentralized identity, with claims from other CCRs
- No tokens, simple yay or nay claim attesting

Technical Components

- Uport for UX
- ERC780: Ethereum Claims Registry
- CCR Factory
 - Create a new CCR
- CCR Core
 - Add Curators
 - Start Claims Race
 - Vote on Claims Race
 - Revoke Claims Race

Tangible Future Use Cases

- Used for smaller case implementations
 - Stating claims on employee status (CV history validated through claims)
 - Award voting (Winner attribute voted into issuance)
 - Simple approved access rights (Claimed valid access)
 - Invite claims (As a single curator in a personal CCR, I can issue claims on behalf of a party entity as a form of ticket and later on add other curators for the work load)
